

Local spatial association in log GDP per capita, 2023

Local Moran quadrants retained after Benjamini-Hochberg adjustment at $q = 0.05$

Notes: First-order queen contiguity; row-standardized weights. Inference uses 255 regions with a neighbor and 99,999 conditional randomizations. High/low is relative to the analysis-sample mean. White regions have no polygon-contiguity neighbor and are not tested. Categories describe association, not causation.
